

ROBUST RGB-D SALIENCY / CORRUPTION TRAINING + REGIONAL ROUTING

Independent predictors • measured error utility • calibrated selection • exact missing-depth fallback

Illustrative test image: NJU2K 001528_left

TRAIN

RGB model: clean RGB

RGB-D model: mixed depth corruptions

Ground truth supervises both

UTILITY

Freeze both predictors; target $u = \text{MAE}(R, Y) - \text{MAE}(C, Y)$

8 pooled channels → score

CALIBRATE

Choose a threshold using the separate calibration split

empirical budget only

TEST

No ground truth enters the router

Depth absent → R exactly

No safety guarantee
